

HTML Basics

1. Introduction to HTML

HTML stands for Hypertext Markup Language, it's the basic building block of the web, allowing you to add, change, and remove website content, making it a crucial skill for web developers, software developers, and others.

2. Importance of Learning HTML

Learning HTML is essential for a career in web development, and it's also useful for marketing and sales professionals, business owners, and freelancers, as it can help them create and edit their own websites.

3. Building a Website

Building a website is like building a house, it needs a solid foundation, and HTML provides that foundation, followed by CSS for styling and JavaScript for functionality.

4. Tools Needed

To learn HTML, you need a web browser and a text editor, with popular choices including VS Code, Sublime Text, and Notepad, and it's recommended to download the Live Server extension for immediate feedback.

5. Setting Up the Environment

To start coding in HTML, you need to set up your environment by downloading and installing a text editor like VS Code, and creating a new folder and file for your website, typically named index.html.

6. Basic HTML Structure

An HTML document starts with a declaration, followed by a pair of HTML tags, which contain the head and body sections, with the head representing information about the page and the body representing the content to be displayed.

7. HTML Tags and Elements

HTML tags are keywords within angle brackets that define how content is formatted and displayed, and elements consist of the opening tag, content, and closing tag, with examples including title, header, and paragraph tags.

8. Header Tags

Header tags, from h1 to h6, are used to create titles and headings on a webpage, with h1 being the largest and h6 being the smallest, and they help structure and organize content.
